

Task 9)

Create a custom AMI and check whether it can be made public. If public access is blocked, disable the block public access setting and then make the AMI public. Verify that the AMI visibility is public.

Step 1: Launch EC2 Instance

Go to EC2 → Launch Instance → Select OS → Launch Instance.

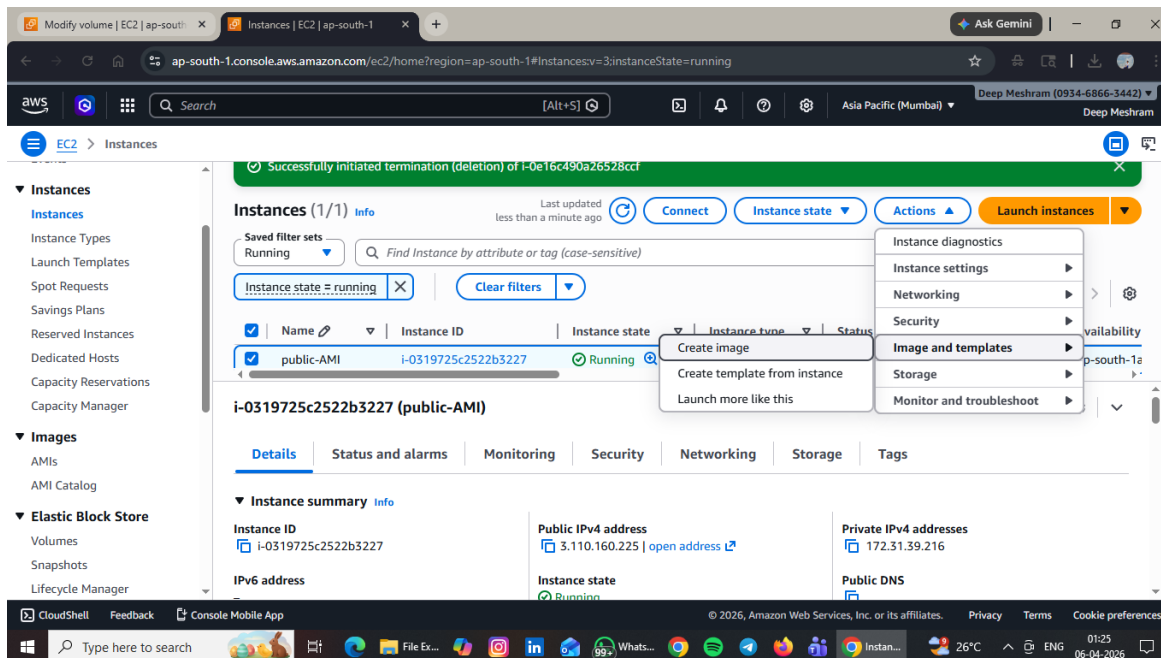

Step 2: Create AMI

Go to:

EC2 → Instances → Select Instance → Actions → Image and Templates → Create Image

The image shows two screenshots of the AWS Management Console. The top screenshot is the 'Create image' page for instance ID i-0319725c2522b3227. It includes fields for 'Image name' (Public-image), 'Image description' (Image description), and a checked 'Reboot instance' option. The bottom screenshot shows the 'Amazon Machine Images (AMIs)' page, listing the created AMI with ID ami-06c3f0c471e508aac and name Public-image. The AMI details section shows it is a Linux/UNIX machine image with x86_64 architecture.

Create image Info

An image (also referred to as an AMI) defines the programs and settings that are applied when you launch an EC2 instance. You can create an image from the configuration of an existing instance.

Image details

Instance ID
i-0319725c2522b3227 (public-AMI)

Image name
Public-image
Maximum 127 characters. Can't be modified after creation.

Image description - optional
Image description
Maximum 255 characters

☒ **Reboot instance**
When selected, Amazon EC2 reboots the instance so that data is at rest when snapshots of the attached volumes are taken. This ensures data consistency.

Step 4: Check If AMI Can Be Made Public

Go to:

EC2 → AMIs → Select AMI → Actions → Modify Image Permissions

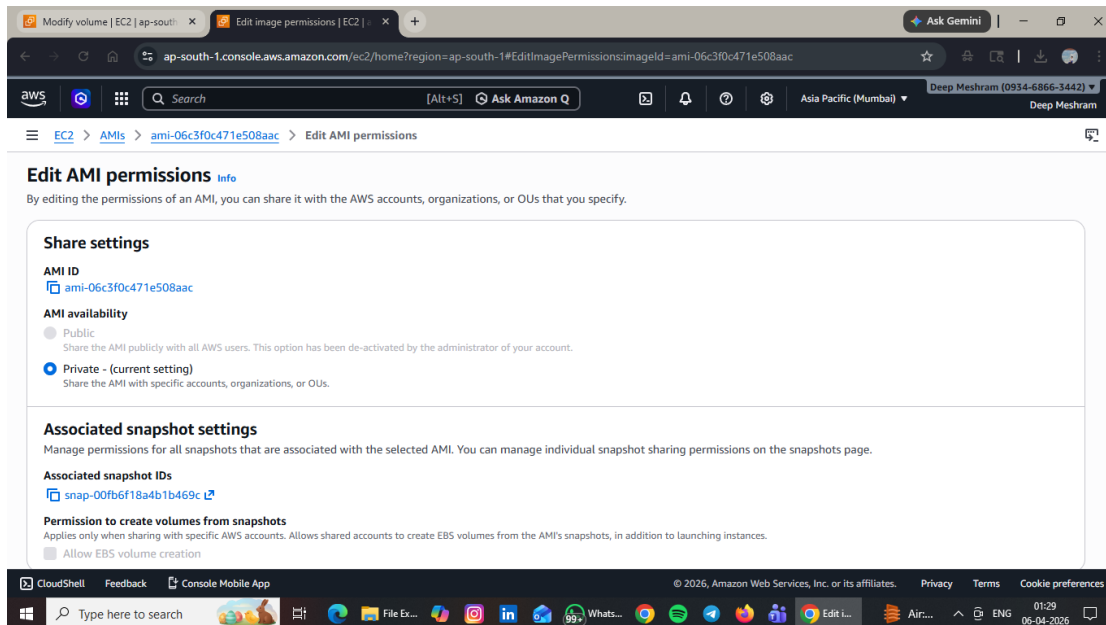

Try to select Public.

If Public Option Works → Save → Go to Step 6

If You Get Error → Go to Step 5

Error Example:

This option has been disabled by the administrator

Step 5: Disable Block Public Access for AMI

Go to:

EC2 Dashboard → Account Attributes → Block Public Access for AMIs → Edit → Uncheck Block Public Access → Save

The screenshot shows the AWS Management Console interface for the 'ap-south-1' region. The breadcrumb navigation indicates the path: **EC2** > **Settings - Data protection and security** > **Manage block public access for AMIs**.

The main heading is **Block public access for AMIs** with an **Info** link. Below it, a subheading reads: "Manage the setting to block or allow the public sharing of your AMIs in this Region."

The setting is represented by a checkbox labeled **Block new public sharing**. The checkbox is currently unchecked. A descriptive text below the checkbox states: "Select the check box to block attempts to publicly share your AMIs. AMIs that are already publicly shared, remain publicly shared."

At the bottom right of the settings card, there are two buttons: **Cancel** and **Update**.

A modal dialog box titled **Allow public sharing** is open in the foreground. It contains the following text:

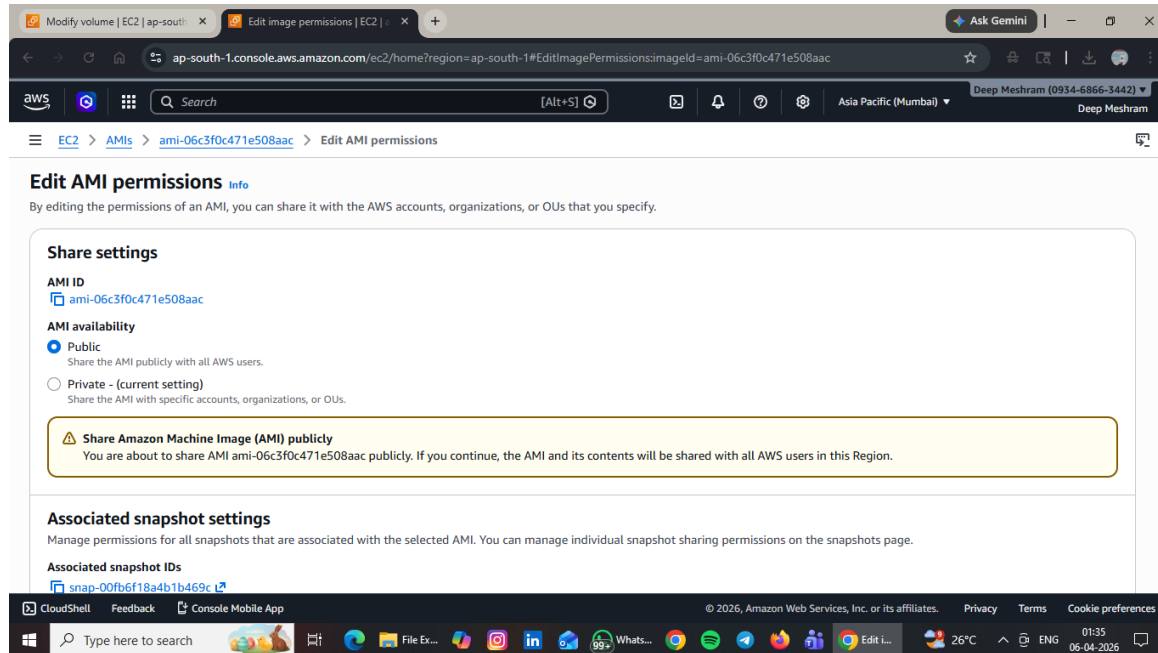

- A warning icon and text: "When this setting is disabled, your AMIs can be publicly shared. Any AWS user can access a publicly shared AMI, which can be a security risk."
- Text: "We recommend that you privately share your AMIs with the accounts that need access to them."
- Text: "To confirm that you want to proceed with allowing the public sharing of your AMIs, enter **confirm**, and then choose **Allow public sharing**."
- A text input field containing the word "confirm".
- Buttons: **Cancel** and **Allow public sharing**.

The background of the console is dimmed while the modal is active. The footer of the console shows the AWS logo, navigation icons, a search bar, and the user's name "Deep Meshram" with their account ID "0934-6866-3442".

Step 6: Make AMI Public

Go to:

EC2 → AMIs → Select AMI → Actions → Modify Image Permissions → Select Public → Save

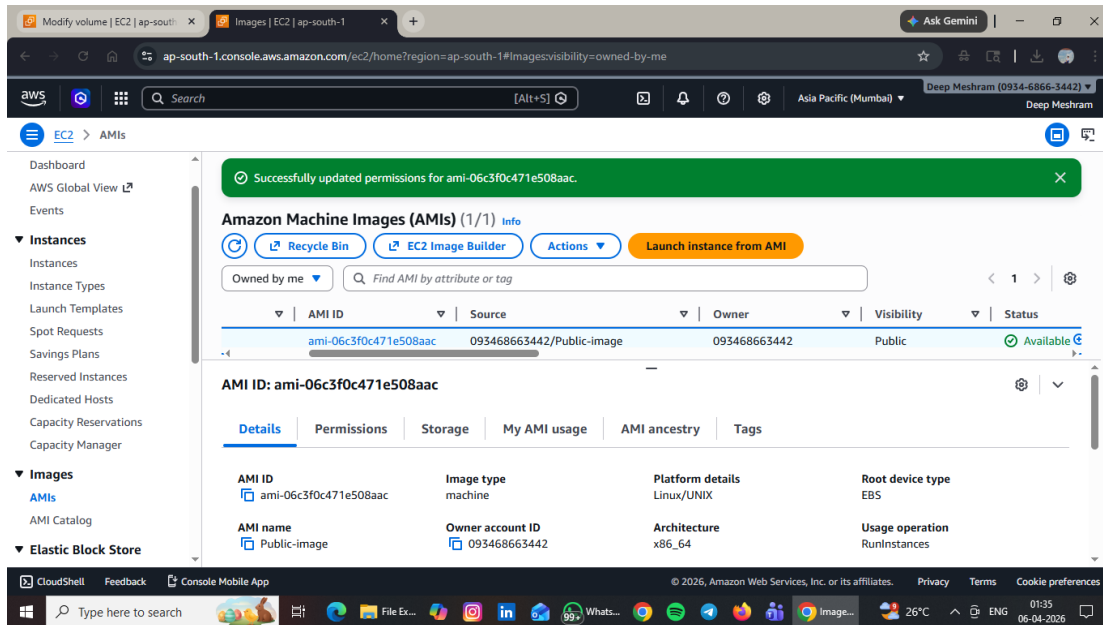

Step 7: Verify AMI Visibility

Go to:

EC2 → AMIs → Select AMI → Details → Check Visibility

It should show:

Public

Final Result :

The custom AMI was created and the public access permission was checked. Since public access was initially blocked, the Block Public Access setting was disabled. After that, the AMI visibility was successfully changed to public and verified.
